

A photograph of a white and orange MBTA train stopped at a station platform. The train's doors are open, and the platform has a yellow tactile paving strip. The MBTA 'T' logo is visible on the side of the train. The background shows the interior of the train and the station ceiling with lights.

Going Places with Data: A Study of the MBTA

Tim Demling, William Hanvey, Dan McCusker-Alvarez, Emma Sommers, Nick Perrotta, and Daniel Xu

Motivation

- ❑ Boston has the oldest public transit system in the nation
- ❑ How well the MBTA works has the potential to affect the entire city from citizens who use the T as their primary method of transit to businesses who need their employees to arrive on time
 - ❑ 34% of Boston commuters take the MBTA
- ❑ Northeastern was historically a commuter school and many students still use the orange or green line to get to campus

Research Question:

What correlations exist between MBTA service and outside factors?

- ❑ Is there a relationship between potential delays and weather factors, day of the week, month of the year, and stops?
- ❑ Boston's demographics vary widely from neighborhood to neighborhood
- ❑ Some of these neighborhoods may be more reliant on public transportation
- ❑ Is there a relationship between better service and the demographic makeup of that area?

Data Sources

- ❑ MBTA 2020 Orange Line data
- ❑ Other MBTA informational data
- ❑ Weather Underground
- ❑ Boston.gov demographic data (2015-2019)
- ❑ Boston.gov geojson files

GeoJS

WEATHER UNDERGROUND

Preparing Data: Delays

- EDA and Cleaning: fixing issues with NaN, direction ID
- Merged with other data to give each row next + previous stop
- Calculated travel time between stations for each train
- Pivot tables for the time between stations based on date, station, and direction using **median** as the aggfunc
 - Joined weather and precipitation data based on date

- Flagged data with mean > (5% * median) as 'slow days'
 - Heavy positive skew -> variability in travel times

Two ML Algorithms Used:

K-NN

KNN for
estimating slow
day flag - 99.5%
accuracy on test
data

Random Forest

RF for estimating
time between stops-
6.9 mean absolute
error on test data

MODEL DEMO

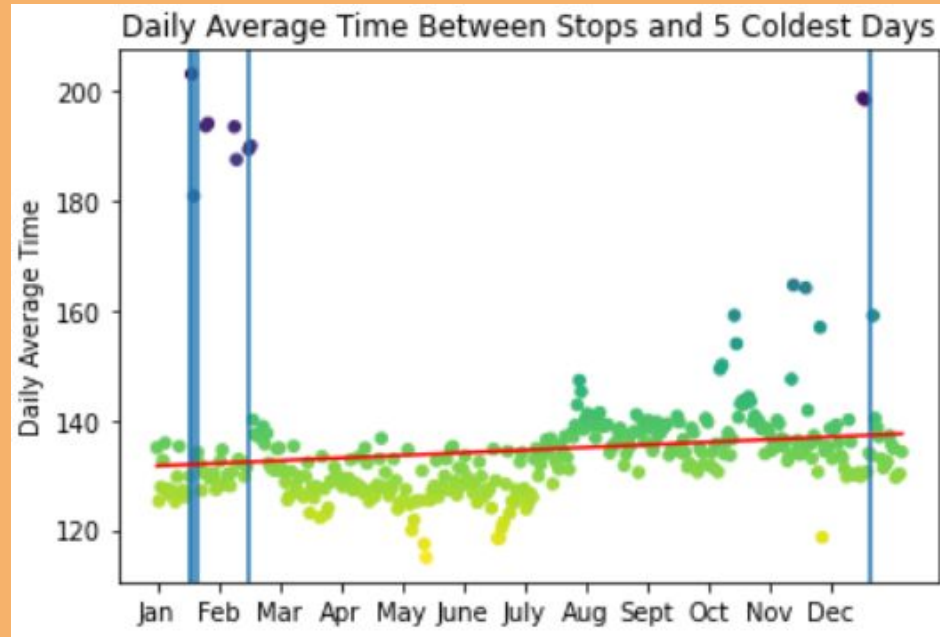

Visualizations: Highest Delay Times

Largest daily average delays: changes in service affect data

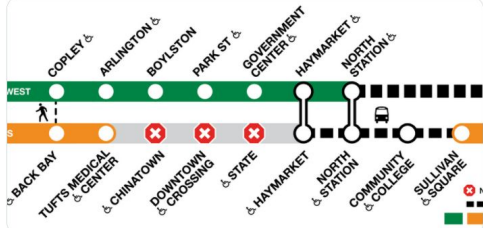

1 point: 1 day

Orange Line Reminder: No Orange Line service between Sullivan & Tufts on weekends from December 12 - December 20. Buses provided between Sullivan & Haymarket. Green Line available between Haymarket & Copley. More: mbta.com/OLwork

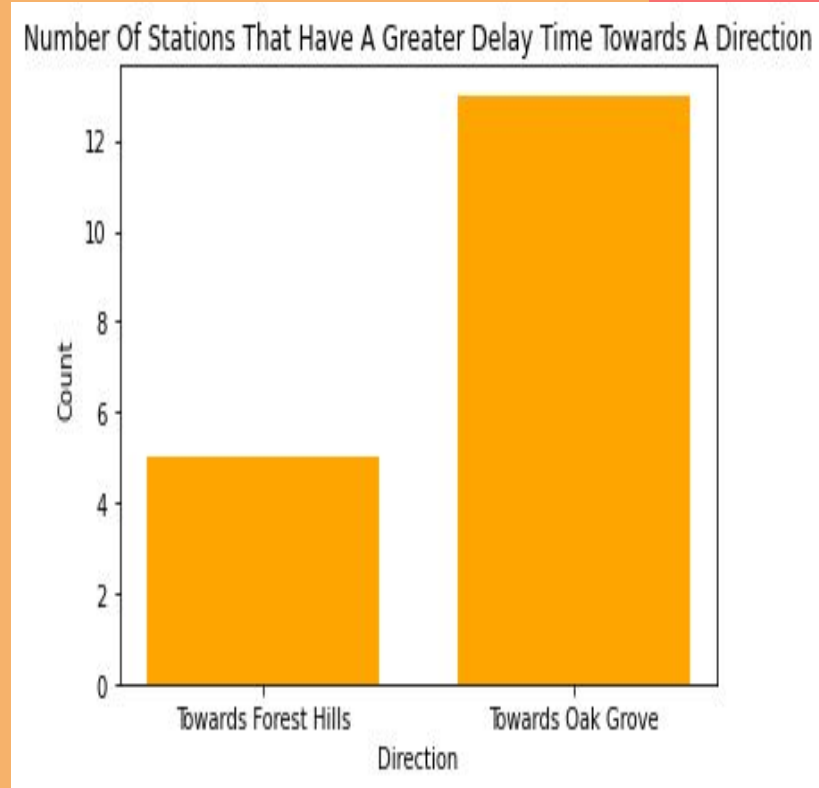

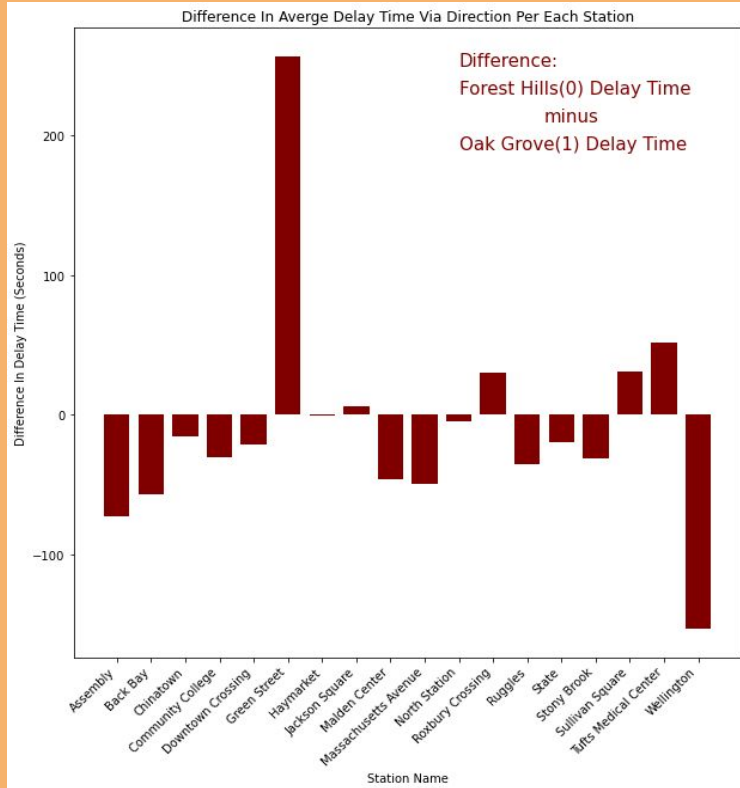

Visualizations: Slow Days & Slow Stations

Visualizations: Looking At Weather & Delay Times

Visualizations: Looking At Delay Times At Each Direction

Moving Forward

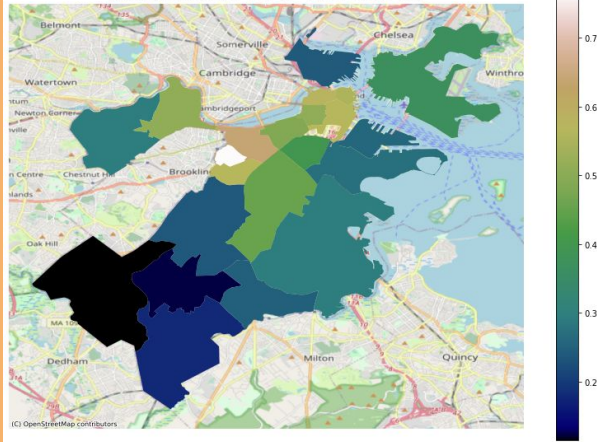

Boston's Demographics

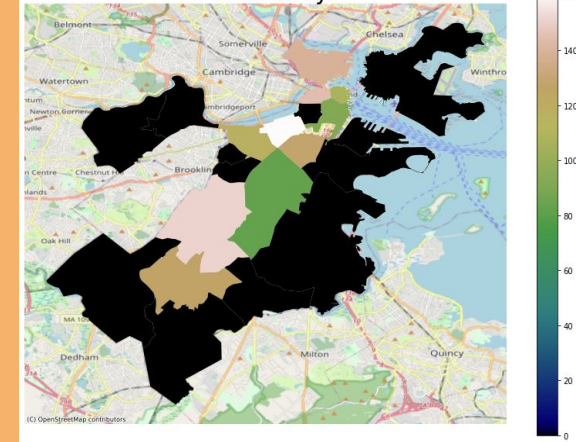

- ❑ Take each demographic statistic from dataset (ie. People without access to a vehicle), create an individual visualization for it
 - ❑ Result is a heatmap-esque plot depicting the neighborhood differences in that specific statistic
- ❑ Find the average delay time each neighborhood experiences
- ❑ Which statistic is most strongly associated with those delay times?
 - ❑ Which demographic groups are the most advantaged/disadvantaged?

No Access to a Vehicle %

GeoPandas

MBTA Delays

Room for Exploration

- ❑ Incorporate a wider range of data
 - ❑ How were delays pre-Covid?
 - ❑ Other MBTA lines?
 - ❑ How do other cities fare?
- ❑ Fill in the gaps of our demographic delay time visualization
 - ❑ Include all neighborhoods
 - ❑ More comprehensive and accurate visualization with different MBTA lines
- ❑ Relevance to current MBTA affairs
 - ❑ How can the MBTA be improved?
 - ❑ How can we ensure certain groups aren't as disadvantaged?
 - ❑ *What* are the causes of these delays?

**Thank you for
Listening!**
